µP Reset Circuits with Long Manual Reset Setup Period
UM807/821/822 *SOT143*

General Description

The UM807/821/822 are low-power microprocessor (µP) supervisory circuits used to monitor power supplies in µP and digital systems. They provide excellent circuit reliability and low cost by eliminating external components and adjustments when used with 5V-powered or 3V-powered circuits. The UM807/821/822 also provide a debounced manual reset input with long setup period.
On all devices, the reset output asserts when the V_{CC} supply voltage drops below its specified threshold. The reset output remains asserted for the reset timeout period (240ms typ) after V_{CC} rises above the reset threshold. The reset output is one-shot pulse asserted for the reset timeout period (140ms min) when manual reset input is held low for a fixed setup timeout period. These devices ignore manual reset transitions of less than the fixed setup timeout period.
The UM807 has an active-low $\overline{\text{RESET}}$ with open-drain output, the UM821 has an active-low $\overline{\text{RESET}}$ with push-pull output, and the UM822 has an active-high RESET with push-pull output. These devices, offered in small SOT143 package, are fully guaranteed over the extended temperature range (-40℃ to +85℃).

Applications

- Set-Top Boxes
- Consumer Electronics
- DVD Players
- Cable/DSL Modems
- MP3 Players
- Industrial Equipments
- Automotive
- Medical Devices

Features

- No External Components
- V_{CC} Transient Immunity
- Correct Logic Output Guaranteed to V_{CC}=1.0V
- Precision V_{CC} Monitoring of 3.0V, 3.3V and 5.0V Supplies
- 2µA Supply Current
- 140ms Minimum Power-On Reset Pulse Width
- Available in 3 Manual Reset Setup Periods (t_{MR}):
  A: 10.08s
  B: 6.72s
  C: 1.68s
- Available in 3 Output Configurations:
  Open-Drain Active-Low $\overline{\text{RESET}}$ Output (UM807);
  Push-Pull Active-Low $\overline{\text{RESET}}$ Output (UM821)
  Push-Pull Active-High RESET Output (UM822)
- 4-Pin SOT143 Package
- Wide Operation Temperature: -40℃ to +85℃

Pin Description

Pin Number	Pin Name	Function
1	GND	Ground
2	$\overline{\text{RESET}}$ (UM807/821)	Active-Low Push-Pull or Open-Drain Output. $\overline{\text{RESET}}$ changes from high to low when V_{CC} drops below its reset threshold and remains low for the 240ms reset timeout period after V_{CC} exceeds their reset threshold. $\overline{\text{RESET}}$ is one-shot pulsed low for the reset timeout period (140ms min) after the manual reset input is asserted longer than the specified setup period. For the open-drain output, use a pull-up resistor to V_{CC}. **See Figure 1.**
	RESET (UM822)	Active-High Push-Pull Output. RESET changes from low to high when V_{CC} drops below its reset threshold and remains high for the 240ms reset timeout period after V_{CC} exceeds their reset threshold. RESET is one-shot pulsed high for the reset timeout period (140ms min) after the manual reset input is asserted longer than the specified setup period. **See Figure 1.**
3	$\overline{\text{MR}}$	Manual Reset Input, Active Low. Internal 22kΩ pull-up to V_{CC}. Pull $\overline{\text{MR}}$ low for the typical input pulse width (t_{MR}) to one-shot pulse $\overline{\text{RESET}}$ for the reset pulse width (t_{PW}). **See Figure 2.**
4	V_{CC}	+5V, +3.3V, or +3V Supply Voltage

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Value	Unit
V_{CC}	Supply Voltage	-0.3 to +6.0	V
	RESET, $\overline{\text{RESET}}$ (Push-Pull)	-0.3 to (V_{CC}+0.3)	
	$\overline{\text{RESET}}$ (Open-Drain)	-0.3 to +6.0	
	$\overline{\text{MR}}$	-0.3 to +6.0	
I_{CC}	Input Current, V_{CC}, $\overline{\text{MR}}$	20	mA
I_O	Output Current, RESET, $\overline{\text{RESET}}$	20	mA
P_D	Continuous Power Dissipation (Derate 4mW/℃ above 70℃)	320	mW
T_A	Operating Temperature Range	-40 to +105	℃
T_{STG}	Storage Temperature Range	-65 to +160	℃
	Lead Temperature (Soldering, 10s)	+300	℃

Note 1: Stresses beyond those listed under "Absolute maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Electrical Characteristics

(V_{CC}=5V for L/M/J versions, V_{CC}=3.3V for T/S versions, V_{CC}=3V for R version, and V_{CC}=2.5V for Z version, T_A=-40℃ to +85℃, unless otherwise noted. Typical values are at T_A=+25℃.) (Note 2)

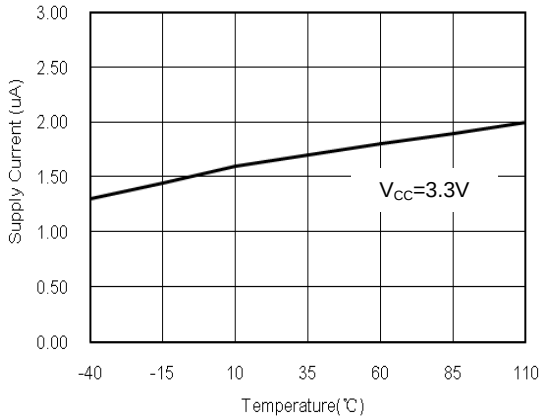
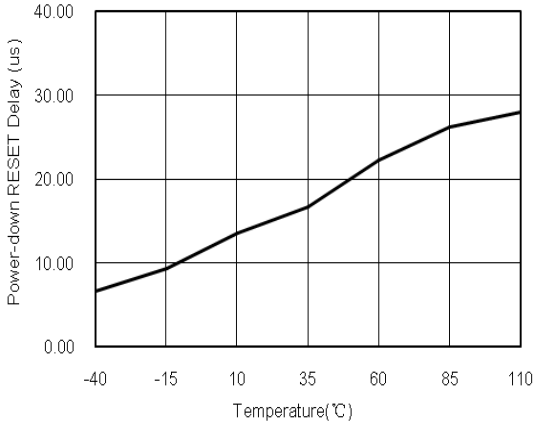
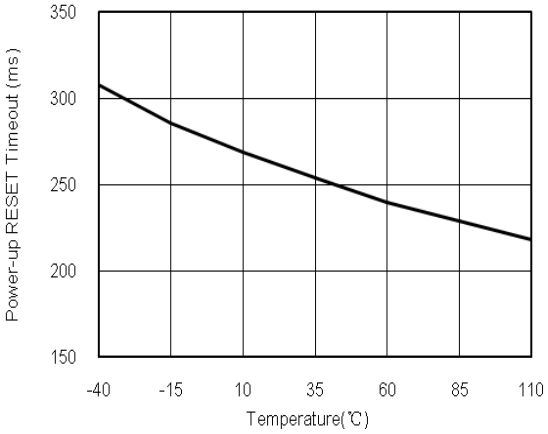
Supply Current vs. Temperature (UM821R_E)



Power-down RESET Delay vs. Temperature (UM821R_E)



Power-up RESET Timeout vs. Temperature



Detailed Description

RESET Timing

The reset signal is asserted LOW for the UM821 and HIGH for the UM822 when the power supply voltage falls below the threshold trip voltage and remains asserted for at least 140ms after the power supply voltage has risen above the threshold.

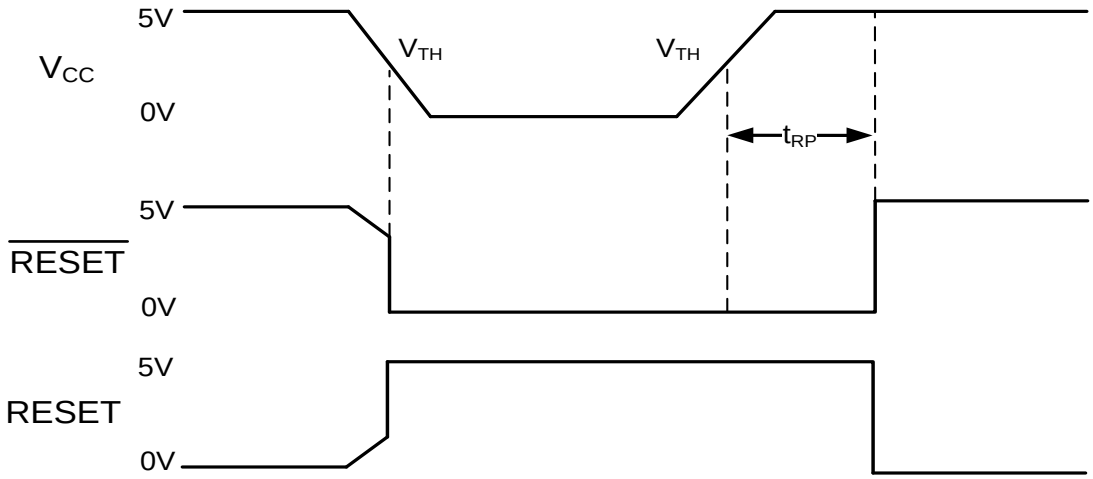


Figure 1. RESET vs. V_{CC} Timing Diagram

Pull $\overline{MR}$ low for the typical input pulse width (t_{MR}) to one-shot pulse $\overline{RESET}$ for the reset pulse width (t_{PW}).

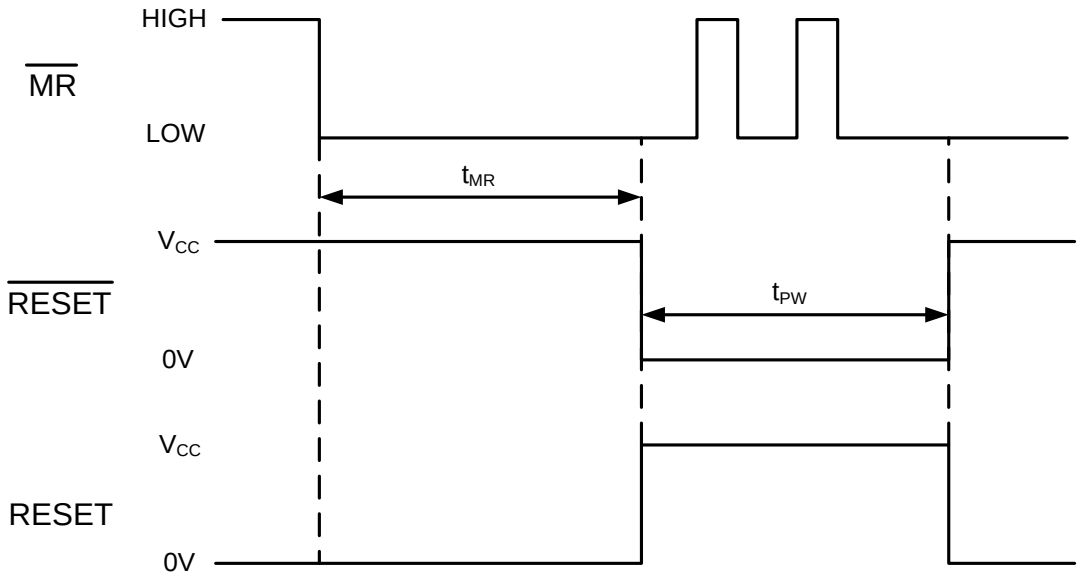

Figure 2. RESET vs. $\overline{MR}$ Timing Diagram

Reset Output

A microprocessor's (μP's) reset input starts the μP in a known state. These μP supervisory circuits

assert reset to prevent code execution errors during power-up, power-down, or brownout conditions. $\overline{RESET}$ is guaranteed to be a logic low for V_{CC}>1V. Once V_{CC} exceeds the reset threshold, an internal timer keeps $\overline{RESET}$ low for the reset timeout period; after this interval, $\overline{RESET}$ goes high.
If a brownout condition occurs (V_{CC} dips below the reset threshold), $\overline{RESET}$ goes low. Any time V_{CC} goes below the reset threshold, the internal timer resets to zero, and $\overline{RESET}$ goes low. The internal timer starts after V_{CC} returns above the reset threshold, and $\overline{RESET}$ remains low for the reset timeout period.
The manual reset input ($\overline{MR}$) can also initiate a reset. See the *Manual Reset Input* section.
The UM822 has an active-high RESET output that is the inverse of the UM807/821's $\overline{RESET}$ output. The UM807 uses an open-drain output, and the UM821/822 have a push-pull output stage. Connect a pull-up resistor on the UM807's $\overline{RESET}$ output to any supply between 0 and 6V.

Manual Reset Input

Each device in the UM807/821/822 family includes one manual reset input, which must be held logic-low for an extended setup period (t_{MR}) before the $\overline{RESET}$ output asserts. When valid manual reset input conditions/setup periods are met, the $\overline{RESET}$ output is one-shot pulse asserted low for a fixed reset pulse width (140ms min). Existing front-panel pushbutton switches (i.e., power on/off, channel up/down, or mode select) can be used to drive the manual reset inputs. The extended manual reset setup period prevents nuisance system resets during normal front-panel usage or resulting from inadvertent short-term pushbutton closure.
This input has an internal 20kΩ pull-up resistor, so it can be left open if it is not used. $\overline{MR}$ can be driven with TTL or CMOS-logic levels, or with open-drain/collector outputs. Connect a normally open momentary switch from $\overline{MR}$ to GND to create a manual-reset function; external debounce circuitry is not required. If $\overline{MR}$ is driven from long cables or if the device is used in a noisy environment, connecting a 0.1μF capacitor from $\overline{MR}$ to ground provides additional noise immunity.

Reset Threshold Accuracy

The UM807/821/822 are ideal for systems using a 5V±5% or 3V±5% power supply with ICs specified for 5V±10% or 3V±10%, respectively. They are designed to meet worst-case specifications over temperature. The reset is guaranteed to assert after the power supply falls out of regulation, but before power drops below the minimum specified operating voltage range for the system ICs. The thresholds are pre-trimmed and exhibit tight distribution, reducing the range over which an undesirable reset may occur.

Applications Information

Negative-Going V_{CC} Transients

In addition to issuing a reset to the µP during power-up, power-down, and brownout conditions, the UM807/821/822 are relatively immune to short-duration negative-going V_{CC} transients (glitches). Figure 3 shows typical transient duration vs. reset comparator overdrive, for which the UM807/821/822 do not generate a reset pulse. The graph was generated using a negative-going pulse applied to V_{CC}, starting above the actual reset threshold and ending below it by the magnitude indicated (reset comparator overdrive). The graph indicates the typical maximum pulse width a negative-going V_{CC} transient may have without causing a reset pulse to be issued. As the magnitude of the transient increases (goes farther below the reset threshold), the maximum allowable pulse width decreases. Typically, for the UM8_ _L_E/M_E/J_E, a V_{CC} transient that goes 125mV below the reset threshold and lasts 40µs or less will not cause a reset pulse to be issued. A 0.1µF capacitor mounted as close as possible to the V_{CC} provides additional transient immunity.

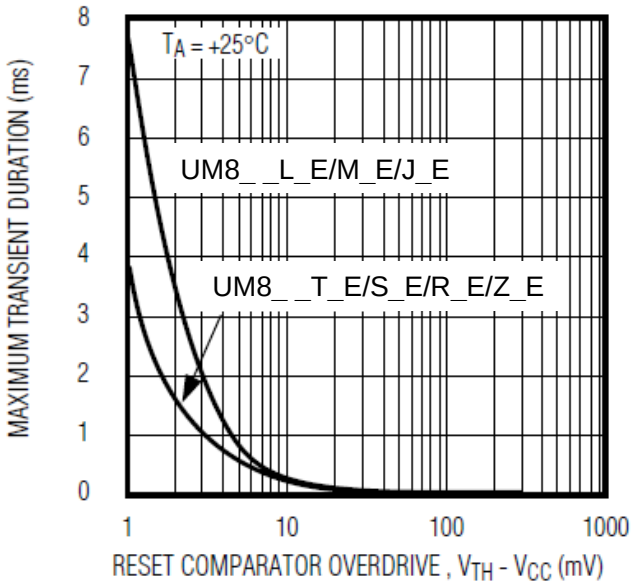

Figure 3. Maximum Transient Duration without Causing a Reset Pulse vs. Reset Comparator Overdrive

Ensuring a Valid $\overline{\text{RESET}}$ Output Down to V_{CC}=0V

When V_{CC} falls below 1V, the UM821 $\overline{\text{RESET}}$ output no longer sinks current—it becomes an open circuit. Therefore, high-impedance CMOS-logic inputs connected to $\overline{\text{RESET}}$ can drift to undetermined voltages. This presents no problem in most applications since most µP and other circuitry is inoperative with V_{CC} below 1V. However, in applications where $\overline{\text{RESET}}$ must be valid down to 0V, adding a pull-down resistor to $\overline{\text{RESET}}$ pin will causes any stray leakage currents to flow to ground, holding $\overline{\text{RESET}}$ low (Figure 4). R1's value is not critical; 100kΩ is large enough not to load $\overline{\text{RESET}}$ and small enough to pull $\overline{\text{RESET}}$ to ground.
A 100kΩ pull-up resistor to V_{CC} is also recommended for the UM822 if RESET is required to remain valid for V_{CC}<1V.

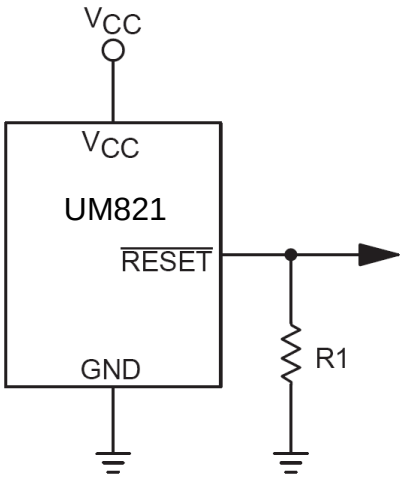

Figure 4. $\overline{\text{RESET}}$ Valid to V_{CC}=Ground Circuit

Interfacing to µPs with Bidirectional Reset Pins

µPs with bidirectional reset pins (such as the Motorola68HC11 series) can contend with the UM821/822 reset outputs. If, for example, the UM821 $\overline{\text{RESET}}$ output is asserted high and the µP wants to pull it low, indeterminate logic levels may result. To correct such cases, connect a 4.7kΩ resistor between the UM821 $\overline{\text{RESET}}$ (or UM822 RESET) output and the µP reset I/O (Figure 5). Buffer the reset output to other system components.

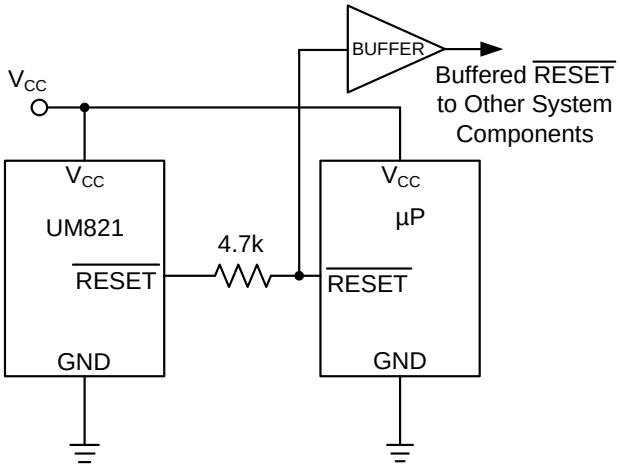

Figure 5. Interfacing to µPs with Bidirectional Reset I/O

UM807 Open-Drain $\overline{\text{RESET}}$ Output Allows Use with Multiple Supplies

Generally, the pull-up connected to the UM807 will connect to the supply voltage that is being monitored at the IC's V_{CC} pin. However, some systems may use the open-drain output to level-shift from the monitored supply to reset circuitry powered by some other supply (Figure 6). Note that as the UM807's V_{CC} decreases below 1V, so does the IC's ability to sink current at $\overline{\text{RESET}}$. Also, with any pull-up, $\overline{\text{RESET}}$ will be pulled high as V_{CC} decays toward 0. The voltage where this occurs depends on the pull-up resistor value and the voltage to which it is connected.

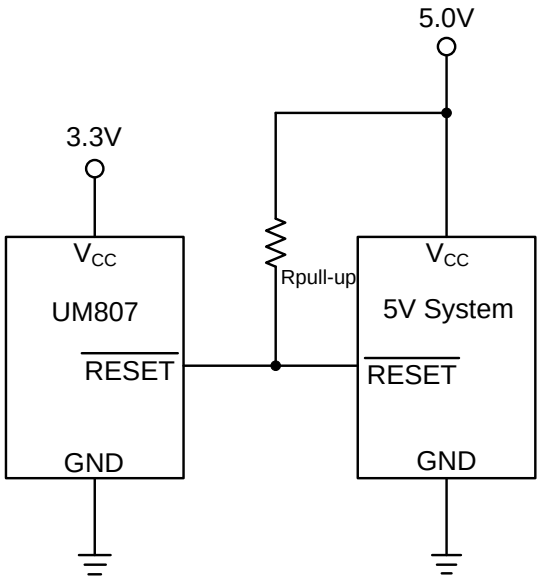

Figure 6. UM807 Open-Drain $\overline{\text{RESET}}$ Output Allows Use with Multiple Supplies

GREEN COMPLIANCE

Union Semiconductor is committed to environmental excellence in all aspects of its operations including meeting or exceeding regulatory requirements with respect to the use of hazardous substances. Numerous successful programs have been implemented to reduce the use of hazardous substances and/or emissions.
All Union components are compliant with the RoHS directive, which helps to support customers in their compliance with environmental directives. For more green compliance information, please visit:
http://www.union-ic.com/index.aspx?cat_code=RoHSDeclaration
