

## Low-Voltage Dual SPDT Analog Switch

**UM3258 DFN12 3.0×1.0**

### General Description

The UM3258 is dual SPDT analog switch fabricated with silicon gate CMOS technology. It achieves very low propagation delay and  $R_{DS(ON)}$  resistances while maintaining CMOS low power dissipation. These make it ideal for portable and battery power applications.

The switch conducts signals within power rails equally well in both directions when on, and blocks up to the power supply level when off. Break-before-make is guaranteed.

The select pin has over-voltage protection that allows voltages above  $V_{CC}$ , up to 6.5V to be present on the pin without damage or disruption of operation of the part, regardless of the operating voltage.

The UM3258 can maintain low power consumption for rail-to-rail signaling as long as the control signal input is held at a level that is greater than  $V_{IH}$  minimum and less than  $V_{IL}$  maximum by improving the control circuitry input buffer. so the part can be used in mixed voltage rail environments, especially services the mobile handset applications very well allowing for the direct interface with baseband processor general purpose I/Os, and it is no longer necessary to have the control input equal to  $V_{CC}$  to maintain low power consumption

The UM3258 is in a 12-pin, ROHS compliant, DFN12 package. It measures 3.0×1.0mm. The leads are spaced at a pitch of 0.5mm and are finished with lead free Ni-Pd. The small package makes it ideal for use in portable electronics such as cell phones, digital cameras and PDAs.

Note 6: Flatness is defined as the difference between the maximum and minimum value of On Resistance over the specified range of conditions.

Note 7: Guaranteed by design.
