1 描述

UMCAN1051 是高速 CAN 收发器，可在控制器局域网（CAN）协议控制器和物理双线式 CAN 总线之间提供接口。该收发器专用于汽车业的高速 CAN 应用，可以为微控制器中的 CAN 协议控制器提供发送和接收差分信号的功能。

UMCAN1051 具备出色的电磁兼容性 (EMC) 和静电防护(ESD)性能。此外，UMCAN1051 还具有以下特点：

- 电源关闭时，CAN总线具有良好的无源性能
- UMCAN1051VS8和UMCAN1051VDA可直接连接电源电压为3.3V和5V的微控制器

UMCAN1051实现了ISO 11898-2:2024和SAE J2284-1至SAE J2284-5中定义CAN物理层。可在CAN FD快速相位下，以高达5 Mbit/s的数据传输速率进行可靠通信。这些特性使UMCAN1051成为各类高速CAN网络的理想选择，特别是不需要通过总线实现唤醒功能的待机模式的节点。

2 应用

- 汽车工业
- 工业控制
- 无线基础设施

3 特性

- 完全符合 ISO 11898-2:2024、SAE J2284-1 至 SAE J2284-5 标准
- 在 CAN FD 快速相位中，时序保证数据速率高达 5Mbit/s
- 适用于 12V 和 24V 系统
- UM1051VS8 与 UM1051VDA 的 V_{IO} 输入允许直接连接至 3.3V 至 5V 的微控制器（分别提供 SOP8 和 DFN8 封装）
- UMCAN1051ES8 的 EN 输入允许微处理器切换 CAN 收发器至超低电流的关断模式
- 收发器会在断电（零负载）时脱离总线
- CAN 总线引脚具有高静电放电（ESD）耐受能力
- TXD 具有显性超时功能
- V_{CC} 与 V_{IO} 管脚欠压检测
- 过温保护

Table 5-1. Pin Functions

Pin No.	Symbol	Description
1	TXD	Transmit data input
2	GND	Ground (Note1)
3	VCC	Supply voltage
4	RXD	Receive data output; reads out data from the bus lines
5	NC	Not connected; in UMCAN1051NS8 version
	EN	Enable control input; UMCAN1051ES8 only
	V_{IO}	Supply voltage for I/O level adapter; UMCAN1051VS8 and UMCAN1051VDA only
6	CANL	Low-level CAN bus line
7	CANH	High-level CAN bus line
8	S	Silent mode control input

Note 1: DFN8 package die supply ground is connected to both the GND pin and the exposed center pad. The GND pin must be soldered to board ground. For enhanced thermal and electrical performance, it is recommended that the exposed center pad also be soldered to board ground.

6 Specifications

6.1 Recommended Operating Conditions

Note 1: Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
Note 2: All voltage values, except differential I/O bus voltages, are with respect to ground terminal.
Note 3: $V_{IO} = V_{CC}$ in non-VIO product variants.
Note 4: Maximum voltage should never exceed 7 V.
Note 5: Verified by an external test house according to IEC TS 62228, Section 4.2.4; parameters for standard pulses defined in ISO 7637.

9 Detailed Description

9.1 Functional Description

The UMCAN1051 is a high-speed CAN stand-alone transceiver with Silent mode. It combines the functionality of transceiver with improved EMC and ESD handling capability. Improved slope control and high DC handling capability on the bus pins provides additional application flexibility. The UMCAN1051 is available in three versions, distinguished only by the function of pin 5:

- The UMCAN1051VS8 and UMCAN1051VDA allow for direct interfacing to microcontrollers with supply voltages down to 3.3 V.
- The UMCAN1051ES8 allows the transceiver to be switched to a very low-current Off mode.
- The UMCAN1051NS8 has the NC pin. This pin is not connected internally. It is a reserved pin intended for package/pinout compatibility or potential future feature expansion.

9.2 Operating modes

The UMCAN1051 supports two operating modes, Normal and Silent, which are selected via pin S. An additional Off mode is supported in the UMCAN1051ES8 via pin EN. See Table 1 for a description of the operating modes under normal supply conditions.

Table 9-1. Operating modes

Mode	Inputs			Outputs	
	Pin EN (Note 1)	**Pin S**	**Pin TXD**	**CAN driver**	**Pin RXD**
Normal	HIGH	LOW	LOW	dominant	Active (Note 2)
	HIGH	LOW	HIGH	recessive	Active (Note 2)
Silent	HIGH	HIGH	X (Note)	recessive	Active (Note 2)
Off (Note 1)	LOW	X (Note 3)	X (Note 3)	floating	floating

Note 1: Only available on the UMCAN1051ES8.
Note 2: LOW if the CAN bus is dominant, HIGH if the CAN bus is recessive.
Note 3: 'X' = Don't care.

9.2.1 Normal mode

A LOW level on pin S selects Normal mode. In this mode, the transceiver is able to transmit and receive data via the bus lines CANH and CANL (see Figure 8-1 for the block diagram). The differential receiver converts the analog data on the bus lines into digital data which is output to pin RXD. The slopes of the output signals on the bus lines are controlled internally and are optimized in a way that guarantees the lowest possible ElectroMagnetic Emission (EME).

9.2.2 Silent mode

A HIGH level on pin S selects Silent mode. In Silent mode the transmitter is disabled, releasing the bus pins to recessive state. All other IC functions, including the receiver, continue to operate as in Normal mode. Silent mode can be used to prevent a faulty CAN controller from disrupting all network communications.

9.2.3 Off mode

A LOW level on pin EN of UMCAN1051ES8 selects Off mode. In Off mode the entire transceiver is disabled, allowing the microcontroller to save power when CAN communication is not required. The bus pins are floating in Off mode, making the transceiver invisible to the rest of the network.

9.3 Fail-Safe Features

9.3.1 TXD dominant time-out function

A 'TXD dominant time-out' timer is started when pin TXD is set LOW. If the LOW state on pin TXD persists for longer than $t_{TO(DOM)TXD}$, the transmitter is disabled, releasing the bus lines to recessive state. This function prevents a hardware and/or software application failure from driving the bus lines to a permanent dominant state (blocking all network communications). The TXD dominant time-out timer is reset when pin TXD is set HIGH.

9.3.2 Internal biasing of TXD, S and EN input pins

Pin TXD has an internal pull-up to V_{IO} and pins S and EN (UMCAN1051ES8) have internal pull-downs to GND. This ensures a safe, defined state in case one or more of these pins is left floating.

9.3.3 Undervoltage detection on pins VCC and VIO

Should V_{CC} or V_{IO} drop below their respective undervoltage detection levels ($V_{UVD(VCC)}$ and $V_{UVD(VIO)}$), the transceiver will switch off and disengage from the bus (high-impedance) until V_{CC} and V_{IO} have recovered.

9.3.4 Overtemperature protection

The output drivers are protected against overtemperature conditions. If the operating junction temperature exceeds the shutdown junction temperature, $T_{J(SD)}$, the output drivers will be disabled until the operating junction temperature falls below $T_{J(SD)}$ and TXD becomes recessive again. Including the TXD condition ensures that output driver oscillations due to temperature drift are avoided.

9.3.5 VIO supply pin

There are three versions of the UMCAN1051 available, only differing in the function of a single pin. Pin 5 is either an enable control input (EN), a V_{IO} supply pin or is not connected. Pin V_{IO} on the UMCAN1051VS8 and UMCAN1051VDA should be connected to the microcontroller supply voltage (see Figure 10-2). This will adjust the signal levels of pins TXD, RXD and S to the I/O levels of the microcontroller. For versions of the UMCAN1051 without a V_{IO} pin, the V_{IO} input is internally connected to V_{CC}. This sets the signal levels of pins TXD, RXD and S to levels compatible with 5V microcontrollers.
